Properties

With Neutritan optimum Neutralization is achieved and no chance of excess neutralization .

Neutritan reacts with the unbound chromium salts and converts them into favourable tanning complexes thereby reducing consumption of chrome tanning agents.

Neutritan having strong complexing acid groups reacts with excess sulphuric acid in the chrome complex and buffers it so that the leather will not loose its strength.

Neutritan helps to obtain uniform and leveled dyeing with anionic dyestuffs.

Neutritan enhances the penetration of fat liquors, vegetable tannins and other retanning agents.

Neutritan helps to avoid Chrome VI formation .
